

Website Development - Setup

After understanding most of the important factors of Website Development, it is now time to set up a webpage. For setting up a webpage, we should adhere to all the steps given below.

Step 1 – Firstly, we purchased a domain name at GODADDY.

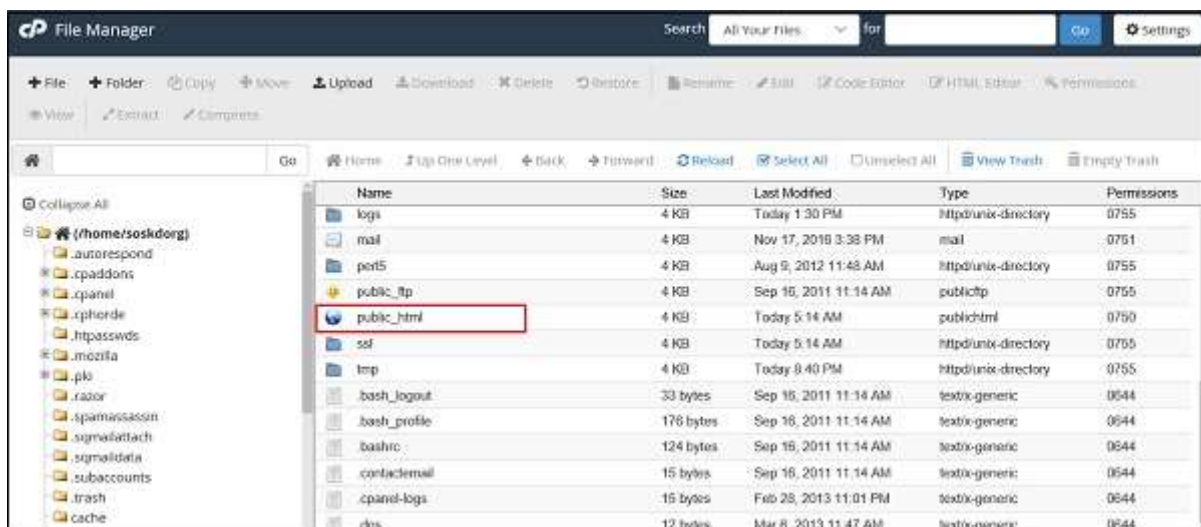

Step 2 – We chose the hosting provider based on the analysis of the hosting plans that we needed.

Step 3 – We configured the DNS records and the DNS servers of the registrar that in our case was GODADDY again.

Step 4 – Now that we are done with all the above-mentioned steps, it is time to upload the files of the webpage through CPanel → File Manager.

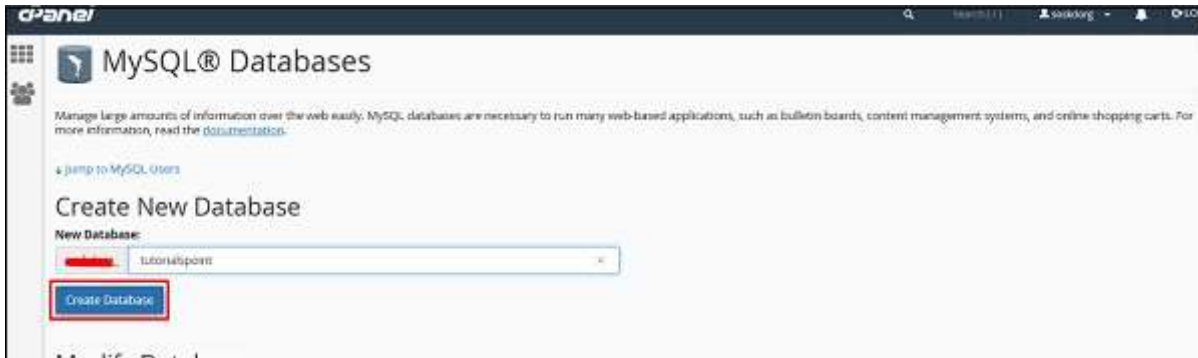

Step 5 – After opening it, upload the files in the folder named **public_html** as shown in the following screenshot.

Step 6 – If you have a dynamic website, then you must configure the database too. To do it, go to MySQL Databases.

Step 7 – Click on **Create New Database** and then write the database name that your website will have and then click on Create Database as shown in the screenshot given below.

Step 8 – In the **Add New User** section type the Username and the password and then click on **Create User**.

Step 9 – We must add the user that we created for this database to give rights or permissions to manage it.
